4.3 ...Net Ionic Equations ...Acids and Bases ...Example 1

$$
\mathcal{H B} r(a q)+\mathcal{K O} \mathcal{H}(a q)=S a l t+\mathcal{W} \text { ate } r
$$

1. Write the formula for the products and determine from 'Solubility Guidelines' whe ther the salt is soluble or not.
2. Balance the chemical equation.
3. Identify the components that are actually in solution.

Is the acid a strong one, if so it dissociates to produce $\mathrm{H}^{+}$and what remains of the formula is the anion. Is the acid a weak one, if so it remains essentially undissociated in solution.
4. Remove the spectator ions.
5. What remains is the 'Net Ionic Equation:
