NCl_3

$$\begin{array}{r} \text{N: } 5 \\ \text{Cl: } 3(7) \\ \hline 26 \\ 3 \times \text{B.P.} \quad - 6 \\ \hline 20 \\ 9 \times \text{L.P.} \quad - 18 \\ \hline 2 \\ 1 \times \text{L.P.} \quad - 2 \\ \hline 0 \end{array}$$

Lone pairs on Cl?

a) 1

b) 9

c) 3 ✓

Notes

- 1) The least electronegative atom is the center ... Why? ... unless otherwise indicated
- 2) Hydrogen, 2 ... [He]; all other atoms, 8 ... [Ne] → [Rn]
- 3) Allocate electrons to the outer atoms first, then attend to the central atom.
- 4) Acceptable shorthand, $- = \bullet\bullet$

Drawing Lewis Structures of Covalent Compounds

Dealing With Charges

$$\begin{array}{r} \text{N:} \quad 5 \\ \text{H:} \quad 4(1) \\ +: \quad -1 \\ \hline 8 \\ 4 \times \text{B.P.} \quad -8 \\ \hline 0 \end{array}$$

$$\begin{array}{r} \text{Cl:} \quad 7 \\ \text{O:} \quad 3(6) \\ -: \quad 1 \\ \hline 26 \\ 3 \times \text{B.P.} \quad -6 \\ \hline 20 \\ 9 \times \text{L.P.} \quad -18 \\ \hline 2 \\ 1 \times \text{L.P.} \quad -2 \\ \hline 0 \end{array}$$

$$\begin{array}{r} \text{Cl:} \quad 7 \\ \text{O:} \quad 4(6) \\ -: \quad 1 \\ \hline 32 \\ 4 \times \text{B.P.} \quad -8 \\ \hline 24 \\ 12 \times \text{L.P.} \quad -24 \\ \hline 0 \end{array}$$

Notes

- 1) Negative charges increases the valence electron total.
- 2) Positive charges decreases the valence electron total.
- 3) Always use parenthesis, either [] or ^{\pm} , for ions.
The most common omission on exams!

What Is a Covalent Bond and How Does One Form?

Drawing Lewis Structures of Covalent Compounds

Shortage of Electrons ... Multiple Bonds

C:	4
H:	2(1)
O:	6
	12
3 x B.P.	- 6
	6
3 x L.P.	- 6
	0

Can we fix the O atom?
Depends on a yes answer to two questions.

1) Do you have a terminal atom with at least one lone pair on it?

2) Are both atoms that are about to make a multiple bond members of the **ENOPS** club?

If yes to both questions, then go ahead and turn a lone pair into a second bond.

H:	1
C:	4
N:	5
	10
2 x B.P.	- 4
	6
3 x L.P.	- 6
	0

Drawing Lewis Structures of Covalent Compounds

Shortage of Electrons ... Multiple Bonds

CO Class Homework Exercise.

? ✓✓

$$\begin{array}{r} \text{C:} \quad 4 \\ \text{O:} \quad 6 \\ \hline 10 \end{array}$$

$$1 \times \text{B.P.} \quad - \frac{2}{8}$$

$$3 \times \text{L.P.} \quad - \frac{6}{2}$$

$$1 \times \text{L.P.} \quad - \frac{2}{0}$$

↳ Considered the central atom as it is the least electronegative of the two.

Notes

Multiple bonds a possibility when the central atom does not have an octet when all the valence electrons have been distributed if —

a) There is a terminal atom with at least one lone pair of electrons and

b) The atoms forming the multiple bond both are members of C, N, O, P, S.
Carbon, Nitrogen, Oxygen, Phosphorus and Sulfur.

 3 \times \text{B.P.} \quad -6 \\
 \hline
 18 \\
 9 \times \text{L.P.} \quad -18 \\
 \hline
 0
 \end{array}$$

Notes

1) \longleftrightarrow Used to denote that a set of Lewis Structures are Resonance Structures.

2) Resonance Structures are not "real" structures – they are extremes – the actual structure is the weighted average of all reasonable Resonance Structures.

↳ We will not be delving into what constitutes a reasonable Lewis Structure.
