24.2 **Nuclear Stability**

The Nucleus – Emitting an Alpha Particle

²³⁴₉₂U undergoes radioactive decay by emitting an alpha particle. As a result of this emission the #Neutron/#Proton ratio -

- a) Increases b) Decreases c) Remains the same

Radiation found at 12 locations

Experts probing the death of former Russian spy Alexander Litvinenko have found traces of radioactivity at 12 locations, the home secretary has said.

Among them are two British Airways (BA) planes. A third one is awaiting checks.

Mr Litvinenko died last week in a

London hospital

Home Secretary John Reid told Parliament that two Russian aircraft, one of which is currently at Heathrow airport, were also of interest.

The Health Protection Agency said 24 people had been referred to a specialist clinic for tests.

BA is contacting 33,000 passengers from 221 flights. But Mr Reid stressed the public health risk was low.

Mr Litvinenko, an ex-KGB officer and a fierce critic of Russian President Vladimir Putin, died last week of radiation poisoning.

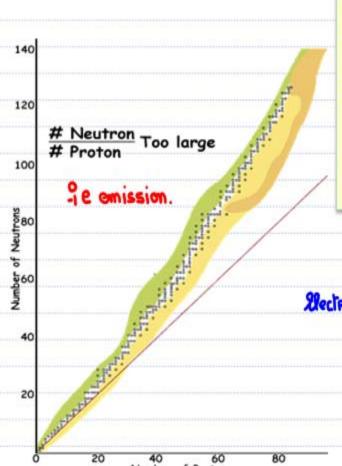

Traces of radioactive polonium-210 were discovered in his body, and more traces of the substance have been found at venues he visited in the capital on 1 November.

Earlier, an inquest into the death of Mr Litvinenko was 210 Po - 4 He + 206 PD

24.2 Nuclear Stability

Predicting Decay Processes

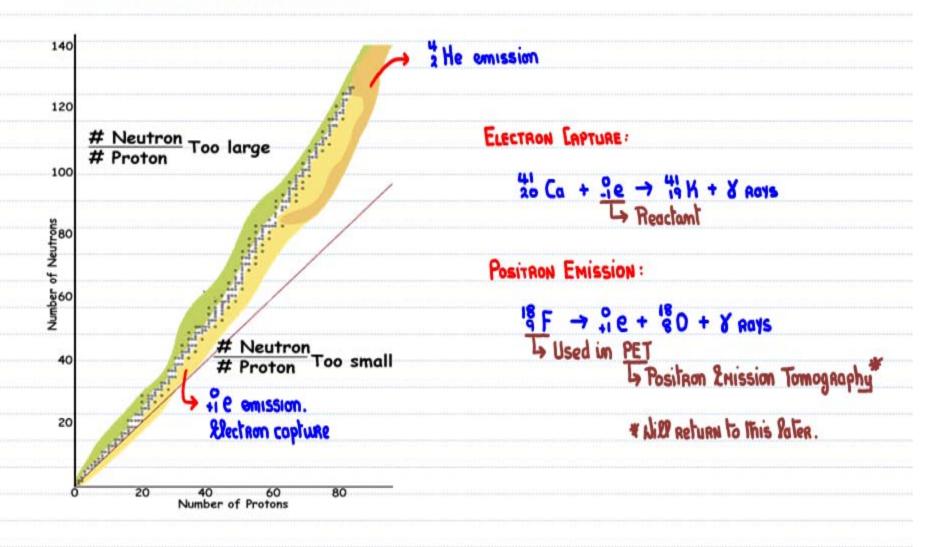

⁶⁰₂₇Co is one of many radioactive isotopes whose #Neutron/#Proton ratio is too large. Radioactive isotopes on this side of the stability have only one form of radioactive decay available to them –

- a) Alpha emission
- c) Electron capture

- b) Positron emission
- d) Beta emission. 🗸
- He : causes #N/#P to 1. X
- Electron capture: Proton converted to Neutron.
 - 9e : Neutron convented to Proton.

24.2 Nuclear Stability Binding Energy

What is the binding energy in kJ/mol nucleons for nitrogen-15?

Masses (g/mol): ${}^{1}_{1}H = 1.00783$; ${}^{1}_{0}n = 1.00867$; ${}^{15}_{7}N = 15.00011$ Speed of Light = $2.998 \times 10^{8} \text{m.s}^{-1}$

24.2 Nuclear Stability Binding Energy

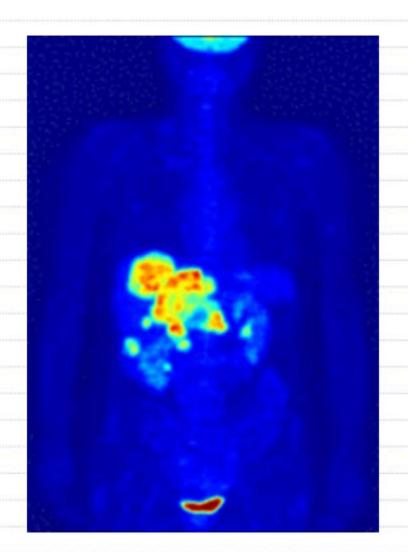

What is the binding energy in kJ/mol nucleons for copper-63?

Masses (g/mol): ${}^{1}_{1}H = 1.00783$; ${}^{1}_{0}n = 1.00867$; ${}^{63}_{29}Cu = 62.92980$? = $\frac{\$}{8}$ Speed of Light = $2.998 \times 10^{8} \, \text{m.s}^{-1}$ Eb = X.XXXXXX10?

$$\Delta E = \Delta m c^{\lambda}$$
= 5.9205 × 10⁻⁴ (2.998 × 10⁸)^{\lambda}
= 5.3213 × 10¹³ J. mol⁻¹
= 5.3213 × 10¹⁰ kJ.mol⁻¹
